

basic steps

1. convert this to jekyll properly 1?. GET RID OF REVOLUTION SLIDER 2.? optimise

3?. convert to netlify - <https://www.netlifycms.org/docs/jekyll/> <-- also use

<https://www.netlifycms.org/docs/add-to-your-site/> 3?. use jekyll-admin/ jekyll-manager, and authenticate using raven - https://github.com/cambridgeuniversity/mod_ucam_webauth/blob/master/README.Config - use `Require user ar899 mhXXX`

4. get it hosted on the srcf - maybe just use netlify from now on? - <https://github.com/Skeith918/self-hosted-netlifycms>

5. add new admins

notes

- use file collections (netlify cms) for static content
- use datafiles to do committee members, etc.? - <https://jekyllrb.com/docs/datafiles/>
- maybe use datafiles for most content since all content is static and nothing new is added (e.g. blog), just changed -

optimisations

- use responsive-image-jekyll
 - <https://github.com/wildlyinaccurate/jekyll-responsive-image>
- lazy-loading, use responsive image to generate low quality image
 - use lazysizes as here: <https://www.ratanparai.com/jekyll/Responsive-image-on-jekyll/>
 - use smaller lazyloading script, as here:
 - requires slightly modifying template in _includes: <https://jekyllcodex.org/without-plugin/lazy-loading/>
- image resizing: <https://www.kevan.tv/articles/automatic-image-resizing-with-jekyll-and-imagemagick/>
